

Static IP

A Static IP lets you take control of your company's Internet usage by hosting your e-mail server, domain names, FTP server, and virtual private network (VPN). You can issue private IP addresses to employees, simplifying Internet and e-mail management. In addition, clients and vendors can access your server from any remote location.

Static IP features:

- Permanent IP address
- Greater network security
- Network address translation
- 24/7 support

Getting Started

To connect with your Static IP, refer to your installation sheet in your Static IP information, and have your TCP/IP address handy. If you did not receive your installation sheet or your TCP/IP address, please contact technical support.

Here is an example of how to configure your TCP/IP settings for Windows XP and Windows 2000 platforms:

1. Click your right mouse button on the My Network Places desktop icon and select Properties from the menu that appears.
2. In the window titled Network and Dial-up Connections, right-click on Local Area Connection and select Properties from the menu that appears.
3. A window titled Local Area Connection Properties will now appear. Select Internet Protocol (TCP/IP) and enter your TCP/IP information.
