

Your business is growing. Is your network keeping up?

5 situations that call for a network boost

1. Slow network performance

Network issues stealing time from employees, frustrating customers? An experienced enterprise-grade provider will find and resolve the root cause of network performance degradation.

2. Phone system overhaul

Your traditional PBX phone system demands significant attention from your IT team to maintain and keep updated. A cloud-based solution frees IT from this burden to focus on strategic projects.

3. Mergers & acquisitions

M&As present an ideal opportunity for IT decision makers to examine how an existing or new Ethernet network can be a boon for the newly formed business entity — helping to sidestep post-deal system problems.

4. New or expanding locations

Need more accessible and affordable connectivity? Look for a provider with an extensive fiber Ethernet network. Leading companies, like Spectrum Enterprise, are investing billions of dollars¹ in infrastructure upgrades.

5. Implementing new apps

Ever install a new app only to have network performance plunge? Avoid this issue with Ethernet service delivered over a network with equal capabilities across endpoints, and abundant capacity that is never oversubscribed.

If your business is experiencing any of these five situations — or any other that impacts network performance — Spectrum Enterprise can help you navigate through the challenges that arise.
